ORVILLE ROCKWELL Jr.

Providence, RI | Rockwell.o@northeastern.edu | 401-574-6797 | LinkedIn | github.com/OrvilleRockwellJr

EDUCATION

Master's in Professional Studies – Applied Artificial Intelligence | Northeastern University *Expected 2027*

Research Interests: Machine Learning, Autonomous Systems & Computational Biology · Concentration: ML for Cybersecurity

Bachelor of Science – Information Technology | Purdue University Global *March 2026*

Chancellor's List 2026 · Asst. Dean's Honors Student Advisory Council · NSLS Honor Society

RESEARCH EXPERIENCE

Research Contributor – GPS-Denied Autonomous Navigation | Brown University, Prof. Benjamin Kimia *2026 – Pres.*

- Contributing to a research team developing GPS-denied drone localization, combining visual-inertial sensor fusion with RF-beacon triangulation to maintain positioning accuracy without satellite navigation.
- Own the multi-camera synchronization and calibration layer: brought up a synchronized camera array on a Raspberry Pi 5 with an Arducam Camarray HAT, contributing calibration routines and tests to the group's repository.

Team Lead – Volatility-Aware Distributional Forecasting (VAD-LSTM) | AAI 6640, Prof. Behnaz Merikhi *2026 – Pres.*

- Leading a four-person team building a recurrent network that forecasts a full probability distribution rather than a point estimate, extending the GARCH–LSTM equivalence of Zhao et al. (2024) with an in-cell variance recursion and a heavy-tailed Student-t output head.
- Own the ten-year point-in-time dataset; validate with purged walk-forward splits, isotonic recalibration and conformal coverage, benchmarked against market-implied prices.

Independent Research – Generative Drug Design for Post-Stroke Repair | AAI 6600 *2026*

- Designed a fully computational pipeline that proposes candidate compounds and scores each for blood-brain-barrier crossing, target activity and toxicity, using the combined score as a reinforcement-learning reward that retrains the generator.
- Applied scaffold-split validation and a held-out judging classifier to prevent circular scoring, reporting precision, recall and PR-AUC rather than accuracy alone.

Independent Research – Calibration-Aware Active Learning for Closed-Loop Discovery *In progress*

- Testing in simulation, over public bioactivity data, whether the calibration of a scoring model rather than its ranking accuracy governs how many experiments a closed-loop (“self-driving lab”) discovery cycle requires — applying sequential decision-making under uncertainty to molecular discovery.

Machine Learning for Market-Neutral Signal Discovery | AAI 6610 *2026*

- Pilot study testing whether learned signals survive risk adjustment, multiple-testing correction and realistic costs; purged, embargoed cross-validation with every trial logged and scored by a deflated Sharpe ratio to separate skill from selection bias.

WORK EXPERIENCE

Software Onboard Engineer | iTribe (B2C Blockchain & Fintech) *2023 – 2026*

- Built and shipped full-stack features across product rollouts spanning the Middle East, Africa, and North America.
- Led QA smoke and regression testing, sustaining a 90%+ release-readiness rate.

NOTABLE PROJECTS

Computer Vision Engineer – Marine Robotics | Northeastern University (NU Robotics) *2026 – Pres.*

- Developing and deploying computer vision models and sensor fusion for autonomous underwater vehicle perception as part of the software engineering division, contributing to entries in national robotics competitions.

CAD-LLM Platform | github.com/OrvilleRockwellJr/CadLLM

- Converts natural-language specifications into structured CAD parameters through an LLM-backed REST pipeline; designed the prompt-to-parameter translation layer and evaluated outputs against manually specified designs.

APML – Analytical Predictive ML Platform | github.com/OrvilleRockwellJr/Analytical-Predictive-ML-Platform

- End-to-end predictive pipeline from ingestion through feature engineering to training, benchmarking architectures in TensorFlow on both accuracy and inference latency.

TECHNICAL SKILLS

Languages: Python, C++, Rust, SQL, JavaScript, HTML, R, Ruby

ML/AI: PyTorch, TensorFlow, Keras, scikit-learn, XGBoost, OpenCV, ROS, Isaac Gym, MuJoCo, Stable-Baselines3

Tools/Infra: Docker, AWS, Linux, Git, REST APIs, Jira, Raspberry Pi, Wireshark
